The present invention describes a polynucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide casequences given in ABQ81842 and ABQ81843, or a sequence given in C least 90% identity or which hybridises with the sequences given in C ABQ81842 and ABQ81843. Also described is a polynucleotide (II) encoding a C fusion protein, comprising a sequence selected from 1097 sequences given in ABP65258 to ABP66354 ligated in frame to a polynucleotide encoding a C heterologous polypeptide. (I) has antidiarrheic and antibacterial C activities, and can be used as an inhibitor of Salmonella. (I) (which is C a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, cheese, fermented milks, milk based fermented powders, infant formula, pet food or a pharmaceutical composition selected from tablets, piquid bacterial suspensions, dried oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the carpression of the Bifidobacterium gene. ABQ81844 to ABQ81850 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Listing from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                      A thermostable DNA ligase from a hyperthermophilic archaebacterium, e.g. P. furiosus, catalyses template-dependent ligation at temps. of 30-80 degrees C, and retains its catalytic ability when subjected to temps. of 85-100 degrees C. The ligase functions effectively in the ligase chain reaction without significant blunt-end ligation. (Updated on 25-MAR-2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-FEB-1994

                                                                                                                                                                                                                                                                                                                                                                                 WPI; 199
                                                                                                                                                                                                                                                                     The present sequence is that of a purified thermostable DNA ligase isolated from a hyperthermophilic marine archaebacterium, Pyrococcus furiosus (Pfu). The Pfu DNA ligase catalyses template dependent ligation at temperatures of about 30-80 deg.C, and substantially retains its catalytic ability when subjected to temperatures of 85-100 deg.C. It has an estimated mol. wt. of 50-70 kDa. (Updated on 25-MAR-2003 to correct Pifield.)
                                                                                                                                                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thermostable LCR; template
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pfu

PIXPR
                           the invention relates to an isolated nucleic acid comprising any one of the scall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (7) identifying a compound that influences the activity of product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway or a gene on which a proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture compound that inhibits the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational compound that inhibits the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme commotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, clipnin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the invention.
                                                                                                                                                                                                      Query Ma

The invention describes a recombinant DNA construct comprising a consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme compositic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell pathway, for conferring increased resistance to plant disease, for producing galactomannan, construct is useful for increased resistance to plant disease, for producing galactomannan, confirm or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the

Also included are an expression vector comprising the nucleic acid operably linked to a promoter, a recombinant cell transformed/transfected with the nucleic acid (or expression vector), an immunogenic composition comprising the nucleic acid in combination with a comprising an amino acid sequence encoded by the nucleic acid, an immunogenic composition comprising the isolated S. mansoni protein continuous which specifically binds to the isolated S. mansoni protein, an immunogenic composition comprising the isolated S. mansoni protein, an immunogenic composition comprising the isolated S. mansoni protein, an immunogenic composition in specifically binds to the isolated S. mansoni continuous and comprising the isolated S. mansoni protein, an immunogenic composition infection in a subject and a computer readable medium having recorded in it a nucleic acid molecule from S. C. mansoni genome. The nucleic acid molecule is useful for preventing, and composition in the nucleic acid molecule from S. C. diagnosing, or treating S. mansoni infection (schistosomiasis). It can send be used as vaccine against S. mansoni. The present sequence is a contained in electronic form part of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from WIPO at firsting.

It is included in the specification but are not included in the sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to Pseudomonas aeruginosa polypeptides and the golynucleotides encoding them. The sequences are useful in diagnosis and the therapy of pathological conditions, as molecular targets for diagnostics, grophylaxis and treatment of pathological conditions resulting from a component infection, for evaluating a compound, such as a polypeptide, growing anti-P. aeruginosa nucleic acid, as components of including anti-P. aeruginosa drugs, as targets for antibacterial drugs, components for diagnosis and/or treatment of P. aeruginosa-derived peptides or polypeptides, as target infection, and in detection of P. aeruginosa sequences or other sequences infection, and in detection of P. aeruginosa sequences or other sequences in patent in this patent did not form part of the invention. Note: The sequence data for this patent did not form part of the printed in sequences obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation; (8) required for proliferation, or that inhibits proliferation or the biological pathway in which a proliferation and that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous mucleic acids are useful for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening for homologous mucleic acids are useful for identifying proteins or screening for homologous mucleic acids are useful for cequired for proliferation in cells other than 8. aureus, 8. typhimurium, 12 patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

$24761

Cpo 61.1 protein - fruit fly (Drosophila melanogaster)

C;Species: Drosophila melanogaster

C;Date: 20-Feb-1995 #sequence_revision 20-Feb-1995 #te

C;Accession: $24761

R;Bellen, H.J.

submitted to the EMBL Data Library, August 1992
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A;Cross-references: UNIPARC:UPI000017BECA; GB:Z14312
